SURFACE TEST

1. DESCRIPTION OF SAMPLE

One sample labelled “F10 Handscrub B/N 090414” was received on 14/5/2007 and tested on 28/6/2007.

2. TESTS REQUESTED

To determine the residual efficacy of the sample on contaminated surfaces.

3. METHOD OF TEST

(European surface test methods – 1993)

3.1 Surface test:
Two centimetre squared stainless steel discs’ surfaces were seeded with the 0.1 ml organism suspension containing 10^7 organisms/ml and dried at 37 °C for 1 hour. 0.1 ml Sample was dropped onto the dried film, ensuring that the film was totally covered. At 29 min, the surfaces were seeded again with 0.1 ml organism suspension. After 1 min contact time the stainless steel discs were placed in conical flasks containing 10 ml of neutralization medium and shaken to dislodge the cells. The procedure was repeated at 1 hour, 2 hours and 3 hours. Then 0.1 ml of the neutralizer and 10-fold dilutions of it were pipetted and placed into sterile Petri dishes. Nutrient Agar was poured into the Petri dishes, mixed with the contents, and incubated at 37 °C for 2 days. Colony-forming units were counted. Untreated stainless steel discs were used as controls.

3.2 Using
Staphylococcus aureus  ATCC 6538  Sta 10
as test organism.
