

16th October 2017

Test: EN 14476 2013 + A1 2015
Project Code: BT-HAH-01
Test Laboratory: BluTest Laboratories Ltd

Client: Health and Hygiene (Pty) Limited
Test Sample Name: F10SC Veterinary Disinfectant
Batch number: 190140

To Whom It May Concern

Having established that the F10SC disinfectant is virucidal and hence relevant to control/eliminate the FCV virus it is then a question in practice of applying an effective economic concentration with a contact time of at least 15 minutes which when used with repeated frequency (at least daily or before new patient entry) will be effective in reducing the infection risk in animal housing and consulting rooms. The F10 guidelines for use in isolation areas have been found to be very effective when used to control non-enveloped viruses by using a 2 stage approach, initially a physical cleaning application combined with a disinfectant application (1:100 of F10SCXD) to reduce the initial virus challenge followed by a disinfectant application (1:100 of F10SC) left to air dry to complete the decontamination.
